

ABSTRACT

The Abstract has been amended in the attached replacement page to correct the objections of the Office Action. For ease in reviewing, the following changes were made:

“A medical device, such as a syringe driver assembly ~~having driver means~~ for imparting translational movement to a member, ~~the driver means~~ comprising a motor driven unthreaded shaft (200), at least one bearing (260, 270, 280) mounted obliquely to the shaft and having at least one point of contact therewith, and an actuator (800) linked to the at least one bearing for contacting the member wherein rotation of the shaft causes movement of the bearing along the shaft to affect movement of the actuator.
